1. Telecommunication system comprising
 - a controller to be coupled to a network and comprising a controller-generator for generating at least one device-signal destined for at least one device,
 - a first device coupled to said controller and comprising a first device-receiver for receiving at least one device-signal,
 - a second device coupled to said controller and comprising a second device-receiver for receiving at least one device-signal,
 - a remote control unit comprising a control-unit-sender for sending a control-signal for remotely controlling at least one device,characterised in that
 - said controller comprises a controller-sender for sending an interface in response to a trigger-signal and destined for said remote control unit and comprises a controller-receiver for receiving said trigger-signal,
 - said remote control unit comprises a control-unit-receiver for receiving said interface and comprises a control-unit-memory for storing said interface.
 2. Telecommunication system according to claim 1, characterised in that said control-unit-sender is adapted for sending said trigger-signal.
 3. Telecommunication system according to claim 2, characterised in that said trigger-signal comprises an identification-code for identifying a user.

a 4. Telecommunication system according to claim 1, ~~2 or 3~~, characterised in that said trigger-signal comprises either at least a first code for indicating said first device or at least a second code for indicating said second device.

a 5. Telecommunication system according to claim 1, ~~2, 3 or 4~~, characterised in that

- said controller comprises a controller-detector for detecting an interface-amendment, whereby said controller-sender is adapted for sending a request-signal destined for said remote control unit,
- said control-unit-receiver is adapted for receiving said request-signal, whereby said control-unit-sender is adapted for sending said trigger-signal in response to said receiving of said request-signal.

a 6. Telecommunication system according to claim 1, ~~2, 3, 4 or 5~~, characterised in that at least a part of a location in said control-unit-memory at which location said interface has been stored becomes overwritable in response to a further trigger-signal.

7. Controller to be coupled to a network and for use in a telecommunication system comprising

- said controller comprising a controller-generator for generating at least one device-signal destined for at least one device,
 - a first device coupled to said controller and comprising a first device-receiver for receiving at least one device-signal,
 - a second device coupled to said controller and comprising a second device-receiver for receiving at least one device-signal,
 - a remote control unit comprising a control-unit-sender for sending a control-signal for remotely controlling at least one device,
- characterised in that said controller comprises a controller-sender for sending an interface in response to a trigger-signal and destined for said remote control unit and comprises a controller-receiver for receiving said trigger-signal.

8. Device coupled to a controller and for use in a telecommunication system comprising

- said controller to be coupled to a network and comprising a controller-generator for generating at least one device-signal destined for at least one device,
 - a first device coupled to said controller and comprising a first device-receiver for receiving at least one device-signal,
 - a second device coupled to said controller and comprising a second device-receiver for receiving at least one device-signal,
 - a remote control unit comprising a control-unit-sender for sending a control-signal for remotely controlling at least one device,
- characterised in that said trigger-signal comprises either at least a first code for indicating said first device or at least a second code for indicating said second device.

9. Remote control unit for remotely controlling at least one device and for use in a telecommunication system comprising

- a controller to be coupled to a network and comprising a controller-generator for generating at least one device-signal destined for at least one device,
 - a first device coupled to said controller and comprising a first device-receiver for receiving at least one device-signal,
 - a second device coupled to said controller and comprising a second device-receiver for receiving at least one device-signal,
 - said remote control unit comprising a control-unit-sender for sending a control-signal for remotely controlling at least one device,
- characterised in that said remote control unit comprises a control-unit-receiver for receiving an interface originating from said controller and comprises a control-unit-memory for storing said interface.

10. Method for controlling a telecommunication system comprising
- a controller to be coupled to a network and comprising a controller-generator for generating at least one device-signal destined for at least one device,
 - a first device coupled to said controller and comprising a first device-receiver for receiving at least one device-signal,
 - a second device coupled to said controller and comprising a second device-receiver for receiving at least one device-signal,
 - a remote control unit comprising a control-unit-sender for sending a control-signal for remotely controlling at least one device,
- characterised in that said method comprises the steps of
- sending an interface from said controller to said remote control unit in response to a trigger-signal,
 - receiving said interface and storing said interface at said remote control unit.
